

pAc_L21 Baculovirus Transfer Vector

Product Summary

Cat. No: STV04
Quantity: 10 µg/20 µl
Storage: Store at -20°C
Stability: Stable for 6 months in appropriate conditions

Description:

pAc_L21, modified from pAcYM1, is a baculovirus transfer vector designed for high level expression of foreign genes under the powerful AcMNPV polyhedrin promoter. The transfer vector is the modified transfer vector and is used to insert the foreign gene in the cloning steps. It has a bacterial origin of replication and an ampicillin resistance gene in pUC8. The polyhedrin gene sequences are deleted and there are both 5' noncoding and 3' noncoding DNA sequences of polyhedrin gene in pAc_L21. BamHI is used for insertion of the foreign gene and restriction sites, including EcoRV and HindIII, are used to confirm the orientation. There is a L21 enhancer is located between polyhedrin promoter and BamHI cloning site. The AcMNPV sequences flanking the gene, 2kb and 2kb, in the transfer vectors allow homologous recombination with the viral DNA to insert the expression cassette into the polyhedrin locus. pAc_L21 is compatible with superBAC derivatives and any baculovirus system that utilizes homologous recombination in sf9 insect cells.
